Notes Further reading Category:Tablet computers introduced in 2014 Category:Android (operating system) devices Category:Mobile computers Category:Smartphones Category:Samsung Galaxy Category:Mobile phones introduced in 2014Q: Defining a function for a "gene" in R (or another language) I'm new to R. Suppose that you want to make a function that inputs an integer and returns 1 if it is less than 10 , and 2 if it is greater than 10 . I have learned about the anonymous functions from my friend, and I think it should look like this: $>$ gen $=$ function (integer) $\{>$ if (integer return $1>\}$ else $\{>$ return $2>\}>\}>\operatorname{gen}(10)[1] 2>\operatorname{gen}(5)[1] 1>$ gen(7) [1] 1 Right now, it's not working. I have tried to write the function on my own, but it's not correct. I'm very confused. I searched on the internet, but I couldn't find the answer I was looking for. Thank you for reading my question. A: You're not writing the function the right way. You should read up on anonymous functions and create the function just like you have shown. gen gen(10) [1 2d92ce491b
