Role of bronchoscopy in the management of pediatric asthma.

Asthma, the most common chronic childhood disease, is an important cause of morbidity and mortality in the pediatric age group. There are a variety of problems that may adversely affect asthma management in children, including persistence of poor symptom control, drug allergy, overuse of steroids, and lack of education and adequate follow-up of the disease. Bronchoscopy can be used to assess the airways in patients with asthma. Direct visualization of the airways by bronchoscopy is useful in investigating patients with asthma and those in whom a respiratory tract infection is a potential cause of asthma symptoms. Indications for bronchoscopy in children include airway assessment, bronchoalveolar lavage, lung biopsy, and treatment of lung disease. Bronchoscopy also has a role in the management of difficult asthma. To make it easier to obtain, compare, and use measurements in practice, a Digital Protractor DPA25 has been provided for measuring angle and angular displacements. It is capable of measuring angles from zero degrees (0°) to 360° in 1 degree intervals. The measurements are linear, with 0° indicating the starting position and positive numbers indicating angles clockwise. If you need a dual-axis digital protractor, our Dual Digital Protractor DPA35 is the right choice. The DPA25 digital protractor is equipped with a non-ferrous steel barrel and a ball bearing carriage to ensure accurate angle measurement. The DPA25 uses 841A88A5R17A CMOS and P.S.S.S. (Power Supply System Saver) technology to save energy. The DPA25 is equipped with a single shaft mechanism to help you measure precise angles. The ratchet feature on the DPA25 will enable you to measure any angle, as it is not restricted by the size of the carriage. The DPA25 is

equipped with a limited life of 2 million cycles and is rated for heavy duty use. The DPA25 is a versatile digital protractor that is ideal for general use. If 2d92ce491b
