For example, biopsy needles, trans-vaginal ultrasound probes, and alligator forceps are commonly used in connection with medical procedures. However, due to the complex and invasive nature of such procedures, medical probes can be dangerous to use. For example, during biopsy procedures, medical probes are often utilized to collect tissue samples from a patient, which are then analyzed to determine if the tissue is cancerous. To collect a tissue sample, a needle is inserted through the patient's skin and directed into the tissue. After the needle has been inserted, the needle is removed from the patient, and a portion of the tissue sample is collected and stored within the needle. The needle and sample are then transported to a laboratory for further analysis. During this transport, however, the needle is particularly susceptible to damage. For example, needles are often enclosed within a protective outer sleeve. This outer sleeve is typically secured to the needle via an adhesive. The adhesive and needle are then shipped together f3e1b3768c
