A beat-oriented, multi-scale software pitch-shifter that uses \* real analog delay lines (one per note) \* live pitch-shifting as the kit plays \* pitch changes indicated by an LED readout \* zoom in/out with your mousewheel \* and most of all... it's fun! Swoosh Version 3.0 Beta has a new interface that can be switched on with the "PitchShift" setting in the mixer. — NOTE: For VST 2 plugins, download the latest version of the Swoosh plugin from github.com For VST3 plugins, use the ZIP download The main changes since Swoosh 2: \* A new interface has been added: + Zoom in/out with the mousewheel. + Multi-scale pitch shift via the + and - keys. + Audio is routed to the input & output channels. This is especially useful for those who like to use multiple plugins on their host. Audio settings allow to use Swoosh in mono or stereo mode. \* Changes to the Swoosh module: + Interface control: – No longer requires the audio routing patch bay, though the mixing + interface can be selected on the module settings. + Audio routing: – Able to route audio to the input or output audio port. – Able to route the master output to the input or output audio + Ports. + New panning functions. Note: there is a separate volume control for the module, so if it is set at 100% and you turn the audio level down, there will be more than 100% module fading. \* The latency on the VST3 plugins is way lower than Swoosh 2, making the pitch shifter much more responsive. \* It now uses less CPU than the old version. \* MIDI customization has been improved. \* There are now sliders for controlling the internal and output delay times. The audio can be routed to the input port, master output port or sink/source input or output ports. The module can be connected as stereo or mono. \* MIDI customization has been improved. \* There is now a new "Pitch Shift" setting in the mixer. This new plugin is built on the idea of a reverse stereo effect that you may have seen in video games. A feature that allows you to reverse the stereo image without changing the pitch. Not an exact reverse effect, but an interesting direction for new sounds. Features: • The original reverse effect from video games • Reverse effect in the video format so you can hear how it looks • Tons of controls for the original effect including manual controls for when to show left and right channels separately • Controls for the dry/wet mix • Configurable channel routing • Built-in distortion for the bottom end • LFO control for modulation • FX chains for the original effect • Native WAV format (PCM) • Plug-in format (.VST) • (Optional) Free Version with 14 days of trial (and \$10 off full purchase!) When I first laid eyes on the DI-300, I knew I had to have it. Well, it took me about four hours and a little bit of finesse to get it into a usable state. The excellent sound quality and huge bass response are worth every single penny. It really feels like I'm playing a real bass, and not a cheap replica. The mic is also a huge improvement over the original DI-600. It has a punchy, kick-ass sound that lets you get a lot more bass out of your set. It's great for slapping bass and ducking through to the floor. The best part of this mic is the mic stand. It's sturdy, comfortable, and smooth, allowing for quick movement of the mic and long sessions. I highly recommend this mic for any guitarist wanting to do some home recording. Tascam DA-88 You could use this one on vocals or double-tracked guitars, but I can't help but think of this mic as a licks mic. I love to use this to add just a touch of that wall of tube-amp feel to my guitars when I need a bit of punch or crunch. What this mic also does is it keeps everything in my guitar's midrange spectrum, adding that tube compression and providing a bit of low-end "shelf" to my guitars. I can't say how good this mic is for recording a solo guitar because I do both double- and single-tracked solos with it, but I can say it sounds great for recording a band's sound

#### What's New In?

Swoosh is a VST plugin for creating the overdriven/distorted sound of the early '80s. Swoosh lets you create "guitar" sounds or anything else that would benefit from 'old-school' fuzz and distortion. Using only 3 parameters you can tweak the distortion circuit for just the right amount of extreme saturation to the sound. In terms of features: -Four intensity levels for each pitch (from +ve to -ve) with a 3rd intensity level for level-based fade. -3 speed levels for a fast-slow-buzzy-crunchy effect. -Bias of the distortion circuit. -Independent pitch shift. -Independent amplification (the intensity can be turned way up or way down). -Effects-cross over at 1000 Hz (so no noise will be pushed below the cutoff, but below 1000 is unaffected). -Several compression types: fast, slow, lofi, tape/lo-fi, vintage, and LP(enhanced). How to use: Once you've loaded up your tracks, the first thing you should do is turn the amp up to full volume and put the guitar up to full volume – so you hear the full impact of the amp. Now place the plugin at the beginning of the chain, right before the Amp, then set the levels to the ones that you want. You should see the intensity slider at 100% at first; that's where you'll start. The distortion circuit uses an analog circuit with only 3 pins. It's likely that you'll need to move the amp to its extreme rear, to get the most compression. I know I can do this using ng-required. Is there any way to achieve this in angular using form validation? My idea is to have the control with text "Required" at the top of the form and then make it disappear when the form is validated. A: The ng-required attribute is a form directive.
