## What's New In?

Ester de Montesquiou is a French-Spanish playwright and poet. She is considered one of the best French playwrights of the 20th century. She won the 1999 Nobel Prize in Literature. Ganglioglioma associated with a metopic suture. A giant ganglioglioma in the occipital region of a female infant was surgically excised. Histologically, the tumor was characterized by the presence of compact pleomorphic neuroepithelial cells, often multinucleated, arranged in nests and sheets. In the area of the tumor-nest border, the compact neuroepithelial cells intermingled with large ganglion-like cells with large nuclei and scanty cytoplasm. Two previous cases of intracranial ganglioglioma have been reported and no association with a metopic suture has been described. Three point steering column assemblies are typically mounted in vehicles by a driver of the vehicle striking a portion of the steering column. The striking of the column displaces the column and typically causes some force and torque to be applied to the steering column. In the prior art three point steering column assemblies, when the steering column is displaced, this force and torque was accommodated by a linear or helical compression spring. The compression spring mounted on the column of the steering column was typically formed of an elastomeric material. When the force and torque applied to the column by a driver struck the column, the force and torque was transmitted to the driver through the spring. Over time, as a driver repeatedly struck the column, the column would deform the spring and the spring would lose its spring rate. Consequently, the spring would be softer and transmit a larger force to the driver than when the spring was new. If the spring lost its spring rate to an extent where the steering column assembly was not as well balanced as the assembly had been when the spring was new, then steering wheel vibration and vibrations transmitted to the vehicle by the steering column would also increase. In this manner, the driver would experience a harsh feeling to the steering wheel and the steering column. One solution to this problem was to reduce the spring rate of the compression spring. However, to reduce the spring rate of the spring, the spring was formed from a less elastic material. Thus, the spring would transmit less force when struck by the driver.

---

As a result, less force and torque would be transmitted to the driver. Accordingly, when the spring was new, a large force would be transmitted through the spring. However, as the driver struck the column, the spring rate of the spring would be reduced and the force and torque transmitted through the spring to the driver would also be reduced. In this manner, the force and torque applied to the driver by the spring was relatively constant. Typically, the compression spring was provided in the form of a sleeve. Typically, the sleeve was an O-ring
