You will be asked to enter the full path and name of all SEG-Y files. The files you select must have the same number of events, the same key arrays and the same dimensions. The application reads each.segy file and then saves the results in a new.segy file. In that way you can select multiple files, as well as files with multiple channels and channels that are different in each file. SegyMerge Features: \* To join files, you can simply drag them on the window, or use the "Browse" option to add files directly to the application. \* Select files to merge using the 'Browse' button. \* Select the number of events to have in the final.segy file. \* Define new channels for the.segy file. \* Check and select which key arrays should be preserved and which ones to discard. \* Choose whether you want to have common time coordinates (time zero) for each file. \* Start the application from a shell or directly from Windows Explorer. \* Send a mail about your results. \* Set the Output directory where your new.segy file will be placed. \* Change the extension of the output file. \* Print a summary of the analysis. \* Check in the history of your files if there is a.bak file. If there is, it will be used as a backup for your new.segy file. SegyMerge Requirements: SegyMerge uses only.segy files. To start the analysis, it is not necessary to have a previous version of the program on your computer. SegyMerge must be executed from a Command Line window. The command line of SegyMerge is: C:\segymerge.exe -v -d (your\_output\_directory)\ -a (your\_output\_directory)\ -e (your\_output\_directory)\ -f (your\_output\_directory)\ (your\_segy\_file\_1.segy or your\_segy\_file\_2.segy or...) You can also send a mail with your results. This is done by selecting the "Mail server" option and typing your email address. You will be then able to send your results to this address. Please note that when you send a mail to the same address, SegyMerge will overwrite the message that you have already sent.
