Keygen. Structure of ampC genes of
Campylobacter jejuni: hypervariable
regions and distribution of sequence
variants among strains. The *Campylobacter*
jejuni ampC genes were sequenced and
compared to each other and to those of
five *Escherichia coli* isolates that exhibited
phenotypic resistance to cephalosporins.

The *C. jejuni* ampC genes were highly
conserved and were most similar to the *E.*
coli ampC genes. There was a high
incidence of deletions in the promoter
region and the variable region. There was
also a large variation of amino acid
sequence, probably due to insertions and
deletions of amino acids among the strains,
without any relation to their resistance
properties. The strains were divided into
four sequence types (ST) by multi-locus

sequence typing (MLST), and ST-23 was predominant. We found two different alleles of the ST-23 pbp1 gene and one novel allele of the ST-23 pbp2 gene.:
