

MySQL Backup Manager is a simple tool for creating database backup that can store copies of multiple databases. The application allows you to choose to backup multiple databases using the following parameters: Database name Hostname User/login information Password Backup Time Restore Time If you opt to restore the backup, the application would produce two files with the same name, but different extensions. These two files would contain a list of databases that correspond to the two times they were created, from which you can select the desired database. To start the backup operation, you will be asked to enter the name of the Windows service that will be used to run the application in the background. Afterwards, you will need to choose the following parameters: Name of service Backup a database Restore a backup This application offers multiple options that allow you to customize the time interval between updates, the description of the databases, and the backup time, all of which are saved in the user preferences. Most of the backup options are intuitive to the user, making it fast and easy to perform the backups. However, as we all know, there are a few items that are not intuitive and still require a bit of effort to be a bit more specific. One of the methods to backup a database is by using the 'restore a backup' option, which will allow you to choose from the list of existing backups to restore the desired database. As mentioned before, the application will ask you to select which database you want to restore, the backup, and a restore time to restore the file. Once this is done, the application will backup the selected database using the specified file name, and also save the chosen backup file into the same location. Another thing that you might need to know is the procedure for restoring a backup, which is a bit more straightforward. All you have to do is open the application and select the file to be restored, and the application will save the restored file into the desired location. There is also a way to create schedules for the backups and the restore process, which can be found in the application settings. This allows the user to set a new backup time and make a restore time at specified intervals. MySQL Backup Manager is a simple and easy-to-use backup application that will allow you to take full advantage of the usefulness of MySQL in everyday tasks. #### What's New In MySQL Backup Manager?

The application has been designed with simplicity in mind, to make creating and managing the backups as simple as possible. The control panel includes a small window that provides access to the application and to the configuration parameters. The user interface is very simple. Just click on one of the button to perform one of the following: View databases. Create a backup. Delete a backup. View backups. A drop-down list shows the selected databases, along with its ability to generate the backup files. You can configure the backup settings for each database individually. For example, if you're creating a complete backup, you can select a date and time, as well as specify the location where the created files should be saved. Any changes are reflected in the Backup settings page, where you can also activate on-demand backups, creating only the minimum files when they are needed. You can also add a list of trusted authentication MySQL users to perform a backup. The application is able to perform a backup for each of your selected databases, but an on-demand backup is also available. System Requirements: Windows 7/Vista/XP/2000 1GHz processor 400MHz memory 32-bit edition only

Several different types of structural elements, including, for example, building structures, have been used and proposed in the prior art for reinforcement of building foundations. For example, U.S. Pat. No. 4,369,985 discloses a building reinforced by a foundation of a plurality of concrete pilings. The purpose of a piling is to transfer the weight of a building to the soil to prevent uplifting of the foundation. U.S. Pat. No. 4,060,724 and U.S. Pat. No. 4,400,828 disclose a building reinforced by a plurality of steel beams which are partially embedded in soil and extend from a foundation embedded in the ground to joists on the floor of the building. U.S. Pat. No. 4,133,419 discloses a reinforced building having a plurality of partially embedded reinforcing rods which extend upwardly from the foundation, extending through the joists of the building, to provide support for the building. U.S. Pat. No. 5,147,110 discloses a reinforced building having a plurality of reinforcing rods which are embedded to a depth greater than the upper joists of the building, such that the upper joists of the building do not support the building. The reinforcing rods extend
